limitations

42 A2 FI T T Ad Hb

Sy/2 2^d component is always busy; it "pays attention" and adjust things to remain within previous determined guidelines or parameters, automatically; But can be overridden or diverted externally to change performance.

34

Component
②

Sy/2 also busy; less complex.

Care needs
controlled

Sy/2 not as much self-volition. What it does is monitored and directed by Component 2.

Sy/2 Ser. 3 is like a "big dumb guy" as opposed to Ser. 2 which is like a "short smart guy" which manipulates the big dumb guy.

Ser. 3 has only one or two major functions which are extremely important; Ser. 2 has several more "subtle" duties - difference between baseball bat and jiu-jitsu.

Ser. 1 is "along far the ride" - doesn't do anything while 2 + 3 are functioning.

guide

S+1/2 people are away from it. Landscape is barren, empty, like Sonoran chapparal. Tundra

Test

firing range

~4 1/2 done calculations, blueprints, mockups, models, start 2 prototypes, wind tunnel, now finally ops test to determine if it will really do what they want and not screw up. Target's long ways away. Can't be seen by launch crew.

S+1/2 fires from b'ds. fr vehicle. to fast gun; is assembled, attached, wired; gun is cleared. It goes off at an angle, travels rapidly for a while. Follows trajectory contacts intended target directly. Flash; consciousness heat. Doesn't take long. Seems to be surface target.

Object presents extremely strong impression of missile or similar vehicle. Smooth, glossy, streamlined long, thin, tapered w/ slight bulges externally; end has round, concentric ^{thin} nested constructions that are recessed. There are folding protuberances on end which extend when it is important to keep object steady. Inside are 3 major components. The first is cylindrical, uniform in feature throughout, & doesn't do much when other 2 sections are working. Sense of "along for the ride". Sec. 2 is always busy, monitors & controls, functions because of rhythmic pulsing electrical current. It's very complex & intricate, made of metal, plastic, connectors, wires; power stores, power metering devices, etc. Section 3 does only 1 or 2 things but they're important & controlled by sec. 2. Sec. 2 is like a clever little guy controlled by a big dumb guy.

Idea of a "test" - culmination of development process starting from calculations & plans, through model + static testing to final live test & see if it will do what it's really supposed.

Sense that it goes from storage to vehicle to test area, is assembled, area (which is low density vegetation like tundra) is evacuated, thing is put into operation "like" missile launch, follows a trajectory, & impacts designated target which seems to be a large rock & concussion; heat waves.

(P)

Q. Paul you have told me about an object that is made up of several components. ~~You~~ You have also provided some information pertaining to the function of this object. In today's session I would like you to explore the concept of the construction i.e., the shape - the various components. We will also be discussing the function but for now the details of the workings is most important.

A. Is this because the information provided thus far or only because you want more detail.

"It's because I want more detail"

Q. Paul, perhaps if you examined each component separately beginning with the top component, it might help you understand the overall nature of the object.

A. OK - Internal or external

"Internal"

Q. That's the interior. Can you work the exterior -

A. Well the exterior is just a shell covering the interior with some folding projections -

(2)

Q. Paul, I believe you have exhausted the Stage VI shapes - It would be important for us now to determine its function -

A. I'm in a red drive in a missile -

Q. Do you think it might benefit you & Stage V that concept

A. Okay, let try it. - - - (finished with Stage II) - This whole muscle thing still seems to feel good

Q. Okay, if you can't shake it - lets pursue it -

A. Wait a minute some other things are coming through

Q. What is the expected outcome in the event it's utilized - Describe the sequence of events - from storage to what ever it's designed to do
based for

A. I'll do it with an 54 1/2 -
